作业-2.

1. 由 $B_\nu d\nu = B_\lambda d\lambda$. 得 $B_\lambda = B_\nu \left| \frac{d\nu}{d\lambda} \right|$

又 $\lambda\nu = c$. $\nu = \frac{c}{\lambda}$. $\frac{d\nu}{d\lambda} = -\frac{c}{\lambda^2}$.

$$B_\lambda = \frac{2h\nu^3}{c^2} \frac{1}{e^{\frac{h\nu}{kT}} - 1} \frac{c}{\lambda^2} = \frac{2hc^2}{\lambda^5} \frac{1}{e^{\frac{hc}{kT\lambda}} - 1}$$

2. $B_\lambda = \frac{2hc^2}{\lambda^5} \frac{1}{e^{\frac{hc}{kT\lambda}} - 1}$

$$\frac{dB_\lambda}{d\lambda} = 2hc^2 (-5\lambda^{-6}) (e^{\frac{hc}{kT\lambda}} - 1)^{-1} + 2hc^2 \lambda^{-5} (-1) \times (e^{\frac{hc}{kT\lambda}} - 1)^{-2} e^{\frac{hc}{kT\lambda}} \frac{hc}{kT} (-\lambda^{-2})$$

$$= 2hc^2 \left(-5 \frac{1}{\lambda^6} \frac{1}{e^{\frac{hc}{kT\lambda}} - 1} \right) + 2hc^2 \frac{1}{\lambda^7} \frac{e^{\frac{hc}{kT\lambda}}}{(e^{\frac{hc}{kT\lambda}} - 1)^2} \frac{hc}{kT}$$

由 $\frac{dB_\lambda}{d\lambda} = 0$, 得 $5\lambda^7 (e^{\frac{hc}{kT\lambda}} - 1)^2 kT = \lambda^6 (e^{\frac{hc}{kT\lambda}} - 1) e^{\frac{hc}{kT\lambda}} hc$

$$5\lambda (e^{\frac{hc}{kT\lambda}} - 1) = e^{\frac{hc}{kT\lambda}} \frac{hc}{kT}. \quad 5(e^m - 1) = e^m m. \quad m = \frac{hc}{kT\lambda_{\max}}$$

故 $\lambda_{\max} T = \frac{hc}{5k} = b$. 其中 m 由 $me^m - 5(e^m - 1) = 0$ 给出.

or 普朗克方程在长波近似. $\frac{hc}{kT\lambda} \gg 1$. $B_\lambda' = \frac{2hc^2}{\lambda^5} \frac{1}{e^{\frac{hc}{kT\lambda}}}$

$$\frac{dB_\lambda'}{d\lambda} = 2hc^2 \left(-5\lambda^{-6} e^{-\frac{hc}{kT\lambda}} \right) + 2hc^2 \lambda^{-5} \left(+e^{-\frac{hc}{kT\lambda}} \right) \left(+\frac{hc}{kT\lambda^2} \right)$$

由 $\frac{dB_\lambda'}{d\lambda} = 0$. 得 $5\lambda^7 = \lambda^6 \frac{hc}{kT} \frac{1}{\lambda^2}$. $\lambda_{\max} T = \frac{hc}{5k} = b$.

得 $b = 2897.8 \mu\text{m} \cdot \text{K}$.

$$B_\nu' = \frac{2h\nu^3}{c^2} e^{-\frac{h\nu}{kT}} \quad \frac{dB_\nu'}{d\nu} = \frac{2h}{c^2} \left(3\nu^2 e^{-\frac{h\nu}{kT}} + \nu^3 e^{-\frac{h\nu}{kT}} \left(-\frac{h}{kT} \right) \right)$$

由 $\frac{dB_\nu'}{d\nu} = 0$. 得 $3 = \frac{h\nu}{kT}$. $\frac{\nu_{\max}}{T} = \frac{3k}{h}$. $\frac{T}{\nu_{\max}} = \frac{1}{3k} = b'$

$b' = 1.7 \times 10^{-11} \text{ K/Hz}$.

$$3. F_{\odot} = \sigma T_{\odot}^4. \quad 4\pi R_{\odot}^2 F_{\odot} = 4\pi (1\text{AU})^2 F. \Rightarrow F = \left(\frac{R_{\odot}}{1\text{AU}}\right)^2 \sigma T_{\odot}^4.$$

$$\text{即太阳常数 } S = \left(\frac{R_{\odot}}{a}\right)^2 \sigma T_{\odot}^4 = 1358 \text{ W} \cdot \text{m}^{-2}.$$

$$4. (1) \lambda_{\text{max}} = \frac{b}{T} = \frac{2.898 \times 10^{-3} \text{ m} \cdot \text{K}}{2500 \text{ K}} = 1.1 \times 10^{-6} \text{ m} = 1.1 \text{ } \mu\text{m}.$$

(2). 不能. 因其峰值波长接近红外波段. 说明辐射曲线在红外波段占比例可观.

$$(3). 7.35 \text{ cm} \gg 1.1 \text{ mm}.$$

$$B_{\lambda} = \frac{2hc^2}{\lambda^5} \frac{1}{e^{\frac{hc}{\lambda T}} - 1} \approx \frac{2hc^2}{\lambda^5} \frac{kT}{hc} = \frac{2ckT}{\lambda^4}.$$

$$\frac{B_{\lambda}|_{\lambda=7.35\text{cm}}}{B_{\lambda}|_{\lambda=1.1\text{mm}}} = \frac{(1.1\text{mm})^4}{(7.35\text{cm})^4} = 5.0 \times 10^{-12}.$$

5. ΔF 为亮度变化量, F_0 是 0 等星的亮度

$$\Delta m = m' - m = 2.5 \lg \frac{F}{F_0 + \Delta F} - 2.5 \lg \frac{F}{F_0}.$$

$$\frac{\Delta m}{2.5} = \lg \frac{F}{F_0 + \Delta F} - \lg \frac{F}{F_0}.$$

$$m' - 0 = 2.5 \lg \frac{F_0 + \Delta F}{F_0}, \quad m - 0 = 2.5 \lg \frac{F_0}{F_0}.$$

$$m' = -2.5 \lg \left(\frac{F_0 + \Delta F}{F_0} \right) = -2.5 \lg \left(1 + \frac{\Delta F}{F_0} \right) + m.$$

$$= -2.5 \frac{\ln(1 + \frac{\Delta F}{F_0})}{\ln 10} + m \approx -\frac{\Delta F}{F_0} + m. \quad \Delta F = \pm 5\% F_0.$$

$$\text{即 } m' = 7.05 + m. \quad \text{星等变化 } 0.05.$$

6. F_0 是 0 等星的亮度.

$$F_0 = F_1 + F_2 + F_3.$$

$$1.0 - 0 = 2.5 \lg \frac{F_0}{F_1}, \quad 2.0 - 0 = 2.5 \lg \frac{F_0}{F_2}.$$

$$F_3 = F_0 (1 - 10^{-\frac{2}{2.5}} - 10^{-\frac{4}{2.5}}).$$

$$\text{星等: } m_3 = 2.5 \lg \frac{F_0}{F_3} = 0.88.$$

$$\text{消光: } \Delta m = 2.5 \lg \frac{F_0}{0.85 F_0} = 0.18.$$

7. 超新星爆发前: 绝对星等 0 等星光度为 F_0 .

$$m - 0 = 2.5 \lg \frac{F_0}{F_1} \quad \text{则} \quad F_1 = 10^{-2} F_0.$$

$$F_2 = 10^9 F_1 = 10^7 F_0.$$

$$M - 0 = 2.5 \lg \frac{F_0}{F_2} \quad \text{则} \quad M = 2.5 \lg 10^{-7} = -17.5.$$

$$m - M = 5 \lg \frac{r}{10 \text{ pc}} \quad \text{则} \quad m = -17.5 + 5 \lg (69 \times 10^3) = 6.7.$$

8. $m = m_0 + K \frac{1}{\cos \theta}$. θ 为天顶距.

由最小=乘积以令 θ 垂直为 $m = 0.164 \frac{1}{\cos \theta} + 0.6882$.

则 $m_0 = 0.6882$, $K = 0.164$.
